

Webinar | Child Well-being Matters: Global Dissemination of Study Findings – Q&A Record

Measurement of Wellbeing Outcomes

All wellbeing intermediate outcomes – safety, agency, relationships, basic needs - were drawn from the Alliance’s *Contextualizing and Measuring Child Well-Being in Humanitarian Action*. One of the objectives of the study was to validate this Alliance Child Well-Being tool for use in research on case management, we hope to publish the results soon in an academic paper. In addition to the Alliance’s tool, wellbeing outcomes were measured through different tools including: Kidscreen¹ (which consists of 27 questions that reflect 5 dimensions: physical wellbeing, psychological wellbeing, autonomy and parent relations, peers and social support, and school environment; and WHO-5² (which is a simple self-reported measure of children’s psychological wellbeing that consists of five positively phrased questions, which can be administered in under five minutes).

Special Needs/Children with Disabilities

The study did not specifically assess changes based on disability status. While further analyses are ongoing, given the limited sample of children we were able to enroll into the study it’s unlikely we will have sufficient power for sub-group analyses. Some of the questions you raise are very important and we hope to explore them in future research.

Study Outputs

A research brief with preliminary study findings is available on the [Alliance website](#). An academic paper will be published in the near future and the relevant link will also be added to the same page. The practitioner tools are also available on the [Alliance website](#).
