Sexual and gender-based violence (SGBV) is an issue of grave concern during the COVID-19 pandemic. The UNFPA predicts an additional 15 million additional cases of gender-based violence for every 3 months that the lockdown continues (UNFPA, 2020, p.2).

Existing research suggests that humanitarian emergencies like COVID-19 tend to exacerbate existing social inequalities. SGBV is not an exception. Issues around health, security, and finances are likely to come under further strain in the face of home-based quarantines. The effects of SGBV are also highly gendered. Lockdowns may mean victims are forced to stay at home with their abuser, while not having access to shelters, or other formal or informal groups that could provide help. Despite the efforts to ramp up SGBV hotlines, many cases will still go unreported. Those who aim to promote the protection of children recognize the crucial role of addressing SGBV: one will not get solved without the other. The purpose of this evidence synthesis is to take stock of the emergent SGBV issues as they arise in news media and from academic sources. Our goal is to produce a short digest that can identify emerging child protection risks and gaps related to the evidence gathered in order to supplement practitioner analyses and responses.
To produce this evidence synthesis, we identified 93 media articles written between April 22 and May 22, 2020 and in either English or French, as well as a dozen of academic articles that provided evidence of emerging COVID-19 related child protection risks on different aspects of SGBV. The rest of this synthesis is organized in the following way: we illustrate the identified child protection risks with compelling stories from select articles and research studies, discuss key gaps in the data gathered, and provide a non-exhaustive list of key resources, academic articles, and news articles used to inform the synthesis.

We are also currently requesting case studies of firsthand experiences – including emerging responses, best practices, and challenges – with addressing SGBV, as well as other child protection risks, in the context of COVID-19.

<tr>
<td>RISKS</td>
</tr>
<tr>
<td>-------------------------------</td>
</tr>
</tbody>
</table>
| **Social Isolation and Intimate Partner Violence, including sexual violence** | • Greater risk to LGBT children **forced to shelter at home** with emotionally and/or physically abusive family member  
  • **Controlling behaviors** can be aggravated by the forced confinement  
  • **Exacerbated gender norms, inequalities and other power dynamics** in the home | “Pre-existing gender inequalities and harmful norms have combined with an increased exposure to abusers at home and economic shocks to create a potent mix for violence to thrive. An increase in reported incidents of intimate partner violence have been reported in almost all countries affected by the pandemic.” (Erskine, 2020) |
| **Sexual Exploitation and Trafficking** | • Young girls are **out of school** and more vulnerable to forced marriages and pregnancies  
  • **Orphaned or separated children** also face higher risks of sexual trafficking / exploitation | “During the Ebola outbreak, adolescent pregnancies in some parts of Sierra Leone increased by 65 percent, with reports of over 18,000 girls becoming pregnant during the epidemic (Onyango et al., 2019; UNDP, 2015; UNFPA, 2015). In Sierra Leone, absent intervention to ensure out-of-school girls spent time engaged in productive activities with other girls within their age group, girls’ time spent with older men increased significantly, pregnancies outside of marriage rose, and girls experienced a 16 percent decrease in school enrollment once schools reopened” (Bandiera et al., 2018). |
| **Exploitation Online**       | • Increased use of **unmonitored digital technology** by children  
  • Increased number of **online predators** in search of illicit child materials | “(a) be more exposed to offenders through online gaming, the use of chat groups in apps, phishing attempts via email, unsolicited contact in social media and through less secure online educational applications; (b) be more inclined towards making explicit material to exchange with peers; (c) become lonely and isolated, which offenders may try to benefit from, connecting with them to produce explicit material or to arrange a meeting in real life once restrictions are lifted.” (Europol) |
## CONTRIBUTING FACTORS

| Access to Protection and Justice Services | • **Ability to seek help outside** of the home while confined with abusers  
• **Availability of remote support** (e.g. helplines) and safe access to necessary telecommunication resources |
| Health Service Availability | • **Health systems overwhelmed**  
• Reticence to visit hospitals or clinics out of fear of contracting COVID-19  
• **Inability** of women and children to **discreetly seek in-person health services** while confined with perpetrators  
• Lack of access to maternal health and family planning services, especially for adolescent girls |
| Economic Insecurity and Disruption to Basic Services | • Increased exposure to **risky situations outside the home**  
• **Lack of basic social protections** and deterrants like accompaniment by other women or children  
• Young girls using transactional sex as an **alternative income source**  
• Presence of and **abuse perpetrated by outside aid and non-aid actors** |

“In some countries, calls to helplines have reportedly doubled. In France, government authorities reported that in one week, domestic violence increased by over 30 percent in areas under movement restrictions. In China, media also reported a surge of domestic violence under COVID-19 quarantine. In Tunisia, in the first five days after people were ordered to stay in, calls to a hotline for women suffering abuse increased fivefold. ([Human Rights Watch](https://www.hrw.org/news/2020/04/09/coronavirus-escalates-domestic-violence-world), 9 April 2020) While in Bangladesh due to the ongoing restriction on mobility, lack of information and increased isolation and fear there was a 50% decrease in reports and 30% decrease in Tanzania” ([IRC](https://www.irc.org/press-room/press-releases/new-data-shows-decrease-women-being-able-report-incident-domestic-violence-fragile-and-conflict-affected-countries), 06 May 2020) New Data Shows a Decrease in Women Being Able to Report Incidents of Domestic Violence in Fragile and Conflict-Affected Countries.

“Some women and girls also report having used virtual SRH and GBV services, though there are age differences as a greater percentage adolescent girls from 10-17 (48 percent) had accessed a virtual service than young women from 18 to 24 (38 percent) and adult women from 25 to 23 (49 percent), suggesting that virtual services are more accessible to adolescent girls.” ([UNFPA et al.](https://www.unfpa.org/sites/default/files/document/405670/20200407_UNFPA选取_2020_0.pdf), 2020, p.4)

“...as functional health, transport, food, sanitation, legal, security and other governance structures may temporarily contract or become dysfunctional ([Briody et al.](https://www.columbia.edu/cu/law/ci/idoc']], 2018). This may lead to increased exposure of women and children to unsafe and risky settings, including exposure to sexual violence and harassment during procurement of basic goods, including food, firewood, and water ([Castañeda Cama et al.](https://www.betterdataforbetterdecisions.org), 2020; Bermudez et al. 2019; De Oliveiro et al., 2019; First et al., 2017; WRC, 2009).”([Peterman et al.](https://www.unfpa.org/sites/default/files/document/405670/20200407_UNFPA选取_2020_0.pdf), 2020, p.11)
GAPS

While several child protection risks related to SGBV were identified, we noticed several gaps related to the data with:

- There appears to be little research on how children and adolescents are impacted by SGBV within the home, including from adults but also amongst children (different and same sex siblings).
- More guidance may be needed on how witnesses or allies can provide assistance / support to victims within the context of COVID-19.
- Lack of guidance directed at men on both healthy social and emotional coping, as well as on how to remotely recognize risky and potentially dangerous behavior in their family, friends, or other peers.
- Besides the article of The Telegraph (19 May 2020) Female genital mutilation surges in Somalia with girls stuck at home during lockdown there was not much coverage on the risk of increase of Female Genital Mutilation/Cutting (FGM/C).
- There is a lack of coverage on the risk of sexual exploitation (online or not) as well as risk of human and child trafficking.
- Evidence or observations of potential increase in stigmatization of SGBV as a result of the public health crisis.

CONCLUSION

SGBV has emerged as a major child protection risk during COVID-19. In a comprehensive literature review, Peterman (et al., 2020) identified nine main pathways to violence associated with pandemics: “(1) economic insecurity and poverty-related stress, (2) quarantines and social isolation, (3) disaster and conflict-related unrest and instability, (4) exposure to exploitative relationships due to changing demographics, (5) reduced health service availability and access to first responders, (6) inability of women to temporarily escape abuse partners, (7) virus-specific sources of violence, (8) exposure to violence and coercion in response efforts, and (9) violence perpetrated against health care workers”. This mapping of resources and news articles confirm this analysis. However, due to the nature of the issue (i.e. the personal intimacy and stigma associated with issues surrounding SGBV), much of what happens – especially in the context of a global pandemic – goes unseen.

There are some obvious and additional sensitivities and nuances that must be considered in order to effectively adapt SGBV prevention and response measures in a context like the one we find ourselves in currently. However, under isolated conditions and with restricted movement and access to social and emotional supports and other services, SGBV issues stand to cause immense harm to children and people in situations of vulnerability. To adapt, issues of this nature, in particular, require sharing of experiences – successes, promising approaches, emergent problems and symptoms, and lessons learned – in order to bring the significant, albeit unnoticed, impacts of a pandemic context to light and to provide privy or impacted parties with the necessary tools – to the best of our ability –
to mitigate SGBV risks and consequences in highly complicated circumstances. The need for case studies in this area is apparent. Examples can inform the gaps identified and support production of new evidence to support tools development, fundraising and advocacy work.

CASE STUDIES

We hope to include case studies from practitioners in the field related to emerging issues, best practices, and challenges in addressing SGBV during COVID-19. Case studies can be submitted to The Alliance using the online form found here.
